# Safety Code for General Radio Control Racing

1. A Radio Control racing event, whether or not it is an official AMA *Competition Regulations* event, is one in which model aircraft compete over a prescribed course with the objective of determining a winner by being the *first to cross the finish line or to post the fastest time to complete the course*. In the case where contestants and their callers are located on the course, the only officials who may be located on the course shall be the starter and his/her assistant. The phrase “on the course” refers to any *flying* area beyond the pilot/staging area.
2. *The distance from the nearest pylon to the spectator line will be in accordance with the current AMA Competition Regulations rules for a two- or three pylon course layout.*
3. *I will not fly my model aircraft in a racing competition if it weighs more than twenty (20) pounds, unless the event is AMA sanctioned.*
4. While on the racecourse, with aircraft in flight, all officials, callers, and pilots must properly wear helmets. (See General (A) Safety Code, item #4.)
